

Floches

Extérieur : Beige

Intérieur : Brun foncé

Usually only male deer have antlers, and reindeer are the only species of deer in which both male and female deer have antlers, although the female has much smaller antlers. Bucks shed their antlers each winter and begin to grow new ones in the spring, when the antlers are covered with a layer of skin called antler. Antlers are shed when the antlers are formed.

Female reindeer shed their horns in spring. In addition, neither male nor female deer have horns, and they use long fangs to defend themselves. Male deer have both tusks and horns, while female deer have neither.
